(54) Title: 4-(IMIDAZO[1,2-A]PYRIDIN-3-YL) -PYRIMIDINE DERIVATIVES

(57) Abstract: Compounds of the formula (I) in which R¹, R², V, X, Y and Z have the meanings indicated in Claim 1, are inhibitors of c-Kit kinase, and can be employed for the treatment of cancer.

4-(Imidazo[1,2-a]pyridin-3-yl)-pyrimidine derivatives

BACKGROUND OF THE INVENTION

5 The invention had the object of finding novel compounds having valuable properties, in particular those which can be used for the preparation of medicaments.

10 The present invention relates to 4-(imidazo[1,2-a]pyridin-3-yl)-pyrimidine derivatives which inhibit c-KIT kinase across a wide range of c-KIT mutations and secondary mutations (V654A secondary resistance mutation in Exon 13) that may arise in GIST (gastrointestinal stromal tumor) patients. The compounds of this invention are therefore useful in treating diseases such as cancer. The present 15 invention also provides methods for preparing these compounds, pharmaceutical compositions comprising these compounds, the compounds for use for the treatment of diseases and methods of treating diseases utilizing pharmaceutical compositions comprising these compounds. Gastrointestinal stromal tumors (GISTS) are the most common mesenchymal tumors of the gastrointestinal (GI) tract.

25 C-KIT is a type III receptor tyrosine kinase and plays an important role in the occurrence of cancer. Mutated forms of the receptor tyrosine kinase c-KIT are drivers in several cancers, such as GIST, SM (Systemic Mastocytosis), certain kinds of AML and melanoma, and are therefore attractive targets for therapy. KIT gain of function mutations play an important role in the pathogenesis of 30 gastrointestinal tumors (GISTS).

35 GISTS are defined as c-KIT (CD117, stem cell factor receptor)-positive mesenchymal spindle cell or epitheloid neoplasms. GISTS have commonly primary activating mutations of the KIT gene (90%) leading to ligand-independent activation of the receptor tyrosine kinase c-KIT rendering the tumor dependent on oncogenic KIT activity.

While benefits have been obtained from use of inhibitors of KIT kinase activity such as imatinib, especially in GIST, primary resistance occurs with certain oncogenic mutations. Furthermore, resistance frequently develops due to 5 secondary mutations (L.K.Ashman & R.Griffith (2013) Expert Opinion on Investigational Drugs, 22:1, 103-115). It has been reported that, Imatinib treatment of GISTS with primary mutation has an initial response rate of ~ 70% but that acquired resistance develops in 40-50% of cases with an average of two years.

10 The secondary mutation V654A in exon13 is the most frequent resistance mutation post Imatinib.

L.L. Chen et al. describe "A Missense Mutation in KIT kinase domain 1 correlates with imatinib resistance in gastrointestinal stromal tumors" in Cancer res. 2004; 15 64:5913-5919. K.G. Roberts et al. describe "Resistance to c-KIT kinase inhibitors conferred by V654A mutation" in Mol. Cancer Ther. 2007; 6:1159-1166.

There is a high unmet medical need for development of a safe and specific 20 inhibitor against KIT V654A resistance mutation.

It has been found that the compounds according to the invention and salts thereof have very valuable pharmacological properties while being well tolerated.

25 The present invention specifically relates to compounds of the formula I which inhibit c-KIT kinase, preferably the mutant V654A of c-KIT kinase.

Moreover, compounds of the formula I inhibit PDGFR α (V651D). The gain-of- 30 function mutations of PDGFR α appear to play an important role in development of GISTS without KIT mutations (S.Hirota et al., Gastroenterology 2003;125:660-667).

The host or patient can belong to any mammalian species, for example a primate species, particularly humans; rodents, including mice, rats and hamsters; rabbits; horses, cows, dogs, cats, etc. Animal models are of interest for experimental investigations, providing a model for treatment of human disease.

5

The susceptibility of a particular cell to treatment with the compounds according to the invention can be determined by *in vitro* tests. Typically, a culture of the cell is combined with a compound according to the invention at various concentrations for 10 a period of time which is sufficient to allow active agents such as anti IgM to induce a cellular response such as expression of a surface marker, usually between about one hour and one week. *In vitro* testing can be carried out using cultivated cells from blood or from a biopsy sample. The amount of surface marker expressed is 15 assessed by flow cytometry using specific antibodies recognising the marker.

15

The dose varies depending on the specific compound used, the specific disease, the patient status, etc. A therapeutic dose is typically sufficient considerably to reduce the undesired cell population in the target tissue while the viability of the patient is maintained. The treatment is generally continued until a considerable 20 reduction has occurred, for example an at least about 50% reduction in the cell burden, and may be continued until essentially no more undesired cells are detected in the body.

25 to ammonium, the alkali metal salts sodium and potassium, and the alkaline earth metal salts calcium and magnesium. Salts of the compounds of the formula I which are derived from pharmaceutically acceptable organic non-toxic bases include salts of primary, secondary and tertiary amines, substituted amines, also including naturally occurring substituted amines, cyclic amines, and basic ion exchanger resins, for example arginine, betaine, caffeine, chloroprocaine, choline, N,N'-dibenzyl-
30 ethylenediamine (benzathine), dicyclohexylamine, diethanolamine, diethylamine, 2-diethylaminoethanol, 2-dimethylaminoethanol, ethanolamine, ethylenediamine, N-ethylmorpholine, N-ethylpiperidine, glucamine, glucosamine, histidine,
35 hydrabamine, isopropylamine, lidocaine, lysine, meglumine, N-methyl-D-glucamine, morpholine, piperazine, piperidine, polyamine resins, procaine, purines, theobromine,

triethanolamine, triethylamine, trimethylamine, tripropylamine and tris(hydroxymethyl)methylamine (tromethamine), but this is not intended to represent a restriction.

- 5 Compounds of the present invention which contain basic nitrogen-containing groups can be quaternised using agents such as (C₁-C₄)alkyl halides, for example methyl, ethyl, isopropyl and tert-butyl chloride, bromide and iodide; di(C₁-C₄)alkyl sulfates, for example dimethyl, diethyl and diamyl sulfate; (C₁₀-C₁₈)alkyl halides, for example decyl, dodecyl, lauryl, myristyl and stearyl chloride, bromide and iodide; and aryl(C₁-C₄)alkyl halides, for example benzyl chloride and phenethyl bromide. Both water- and oil-soluble compounds according to the invention can be prepared using such salts.
- 10
- 15 The above-mentioned pharmaceutical salts which are preferred include acetate, trifluoroacetate, besylate, citrate, fumarate, gluconate, hemisuccinate, hippurate, hydrochloride, hydrobromide, isethionate, mandelate, meglumine, nitrate, oleate, phosphonate, pivalate, sodium phosphate, stearate, sulfate, sulfosalicylate, tartrate, thiomalate, tosylate and tromethamine, but this is not intended to represent a
- 20 restriction.

Particular preference is given to hydrochloride, dihydrochloride, hydrobromide, maleate, mesylate, phosphate, sulfate and succinate.

- 25
- The acid-addition salts of basic compounds of the formula I are prepared by bringing the free base form into contact with a sufficient amount of the desired acid, causing the formation of the salt in a conventional manner. The free base can be regenerated by bringing the salt form into contact with a base and isolating the free base in a
- 30 conventional manner. The free base forms differ in a certain respect from the corresponding salt forms thereof with respect to certain physical properties, such as solubility in polar solvents; for the purposes of the invention, however, the salts otherwise correspond to the respective free base forms thereof.

As mentioned, the pharmaceutically acceptable base-addition salts of the compounds of the formula I are formed with metals or amines, such as alkali metals and alkaline earth metals or organic amines. Preferred metals are sodium, potassium, magnesium and calcium. Preferred organic amines are N,N'-
5 dibenzylethylenediamine, chlorprocaine, choline, diethanolamine, ethylenediamine, N-methyl-D-glucamine and procaine.

The base-addition salts of acidic compounds according to the invention are prepared
10 by bringing the free acid form into contact with a sufficient amount of the desired base, causing the formation of the salt in a conventional manner. The free acid can be regenerated by bringing the salt form into contact with an acid and isolating the free acid in a conventional manner. The free acid forms differ in a certain respect
15 from the corresponding salt forms thereof with respect to certain physical properties, such as solubility in polar solvents; for the purposes of the invention, however, the salts otherwise correspond to the respective free acid forms thereof.

If a compound according to the invention contains more than one group which is
20 capable of forming pharmaceutically acceptable salts of this type, the invention also encompasses multiple salts. Typical multiple salt forms include, for example, bitartrate, diacetate, difumarate, dimeglumine, diphosphate, disodium and trihydrochloride, but this is not intended to represent a restriction.

25 With regard to that stated above, it can be seen that the expression "pharmaceutically acceptable salt" in the present connection is taken to mean an active ingredient which comprises a compound of the formula I in the form of one of its salts, in particular if this salt form imparts improved pharmacokinetic properties on the active
30 ingredient compared with the free form of the active ingredient or any other salt form of the active ingredient used earlier. The pharmaceutically acceptable salt form of the active ingredient can also provide this active ingredient for the first time with a desired pharmacokinetic property which it did not have earlier and can even have a
35 positive influence on the pharmacodynamics of this active ingredient with respect to its therapeutic efficacy in the body.

Isotopes

There is furthermore intended that a compound of the formula I includes isotope-labelled forms thereof. An isotope-labelled form of a compound of the formula I is identical to this compound apart from the fact that one or more atoms of the compound have been replaced by an atom or atoms having an atomic mass or mass number which differs from the atomic mass or mass number of the atom which usually occurs naturally. Examples of isotopes which are readily commercially

available and which can be incorporated into a compound of the formula I by well-known methods include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorus, fluorine and chlorine, for example ^2H , ^3H , ^{13}C , ^{14}C , ^{15}N , ^{18}O , ^{17}O , ^{31}P , ^{32}P , ^{35}S , ^{18}F and ^{36}Cl , respectively. A compound of the formula I, a prodrug, thereof or a

pharmaceutically acceptable salt of either which contains one or more of the above-mentioned isotopes and/or other isotopes of other atoms is intended to be part of the present invention. An isotope-labelled compound of the formula I can be used in a number of beneficial ways. For example, an isotope-labelled compound of the formula I into which, for example, a radioisotope, such as ^3H or ^{14}C , has been incorporated is suitable for medicament and/or substrate tissue distribution assays.

These radioisotopes, i.e. tritium (^3H) and carbon-14 (^{14}C), are particularly preferred owing to simple preparation and excellent detectability. Incorporation of heavier isotopes, for example deuterium (^2H), into a compound of the formula I has therapeutic advantages owing to the higher metabolic stability of this isotope-labelled compound. Higher metabolic stability translates directly into an increased in vivo half-life or lower dosages, which under most circumstances would represent a preferred embodiment of the present invention. An isotope-labelled compound of the formula I can usually be prepared by carrying out the procedures disclosed in the synthesis schemes and the related description, in the example part and in the preparation part in the present text, replacing a non-isotope-labelled reactant by a readily available isotope-labelled reactant.

Deuterium (^2H) can also be incorporated into a compound of the formula I for the purpose in order to manipulate the oxidative metabolism of the compound by way of

the primary kinetic isotope effect. The primary kinetic isotope effect is a change of the rate for a chemical reaction that results from exchange of isotopic nuclei, which in turn is caused by the change in ground state energies necessary for covalent bond formation after this isotopic exchange. Exchange of a heavier isotope usually results

- 5 in a lowering of the ground state energy for a chemical bond and thus cause a reduction in the rate in rate-limiting bond breakage. If the bond breakage occurs in or in the vicinity of a saddle-point region along the coordinate of a multi-product reaction, the product distribution ratios can be altered substantially. For explanation:
- 10 if deuterium is bonded to a carbon atom at a non-exchangeable position, rate differences of $k_M/k_D = 2-7$ are typical. If this rate difference is successfully applied to a compound of the formula I that is susceptible to oxidation, the profile of this compound *in vivo* can be drastically modified and result in improved pharmacokinetic properties.
- 15

When discovering and developing therapeutic agents, the person skilled in the art attempts to optimise pharmacokinetic parameters while retaining desirable *in vitro* properties. It is reasonable to assume that many compounds with poor

- 20 pharmacokinetic profiles are susceptible to oxidative metabolism. *In vitro* liver microsomal assays currently available provide valuable information on the course of oxidative metabolism of this type, which in turn permits the rational design of deuterated compounds of the formula I with improved stability through resistance to
- 25 such oxidative metabolism. Significant improvements in the pharmacokinetic profiles of compounds of the formula I are thereby obtained, and can be expressed quantitatively in terms of increases in the *in vivo* half-life ($t_{1/2}$), concentration at maximum therapeutic effect (C_{max}), area under the dose response curve (AUC), and
- 30 F; and in terms of reduced clearance, dose and materials costs.

The following is intended to illustrate the above: a compound of the formula I which has multiple potential sites of attack for oxidative metabolism, for example benzylic hydrogen atoms and hydrogen atoms bonded to a nitrogen atom, is prepared as a

35 series of analogues in which various combinations of hydrogen atoms are replaced by deuterium atoms, so that some, most or all of these hydrogen atoms have been

replaced by deuterium atoms. Half-life determinations enable favourable and accurate determination of the extent of the extent to which the improvement in resistance to oxidative metabolism has improved. In this way, it is determined that the half-life of the parent compound can be extended by up to 100% as the result of
5 deuterium-hydrogen exchange of this type.

Deuterium-hydrogen exchange in a compound of the formula I can also be used to achieve a favourable modification of the metabolite spectrum of the starting

10 compound in order to diminish or eliminate undesired toxic metabolites. For example, if a toxic metabolite arises through oxidative carbon-hydrogen (C-H) bond cleavage, it can reasonably be assumed that the deuterated analogue will greatly diminish or eliminate production of the unwanted metabolite, even if the particular oxidation is not
15 a rate-determining step. Further information on the state of the art with respect to deuterium-hydrogen exchange may be found, for example in Hanzlik et al., J. Org. Chem. **55**, 3992-3997, 1990, Reider et al., J. Org. Chem. **52**, 3326-3334, 1987,

The invention furthermore relates to medicaments comprising at least one compound of the formula I and/or pharmaceutically acceptable salts, tautomers and stereo-isomers thereof, including mixtures thereof in all ratios, and optionally excipients
25 and/or adjuvants. Of course, this shall be understood as including solvates of the compounds and salts.

Pharmaceutical formulations can be administered in the form of dosage units which
30 comprise a predetermined amount of active ingredient per dosage unit. Such a unit can comprise, for example, 0.5 mg to 1 g, preferably 1 mg to 700 mg, particularly preferably 5 mg to 100 mg, of a compound according to the invention, depending on the condition treated, the method of administration and the age, weight and condition of the patient, or pharmaceutical formulations can be administered in the form of
35 dosage units which comprise a predetermined amount of active ingredient per dosage unit. Preferred dosage unit formulations are those which comprise a daily

dose or part-dose, as indicated above, or a corresponding fraction thereof of an active ingredient. Furthermore, pharmaceutical formulations of this type can be prepared using a process which is generally known in the pharmaceutical art.

- 5 Pharmaceutical formulations can be adapted for administration via any desired suitable method, for example by oral (including buccal or sublingual), rectal, nasal, topical (including buccal, sublingual or transdermal), vaginal or parenteral (including subcutaneous, intramuscular, intravenous or intradermal) methods. Such
10 formulations can be prepared using all processes known in the pharmaceutical art by, for example, combining the active ingredient with the excipient(s) or adjuvant(s).

15 Pharmaceutical formulations adapted for oral administration can be administered as separate units, such as, for example, capsules or tablets; powders or granules; solutions or suspensions in aqueous or non-aqueous liquids; edible foams or foam foods; or oil-in-water liquid emulsions or water-in-oil liquid emulsions.

20 Thus, for example, in the case of oral administration in the form of a tablet or capsule, the active-ingredient component can be combined with an oral, non-toxic and pharmaceutically acceptable inert excipient, such as, for example, ethanol, glycerol, water and the like. Powders are prepared by comminuting the compound to a suitable fine size and mixing it with a pharmaceutical excipient comminuted in a
25 similar manner, such as, for example, an edible carbohydrate, such as, for example, starch or mannitol. A flavour, preservative, dispersant and dye may likewise be present.

30 Capsules are produced by preparing a powder mixture as described above and filling shaped gelatine shells therewith. Glidants and lubricants, such as, for example, highly disperse silicic acid, talc, magnesium stearate, calcium stearate or polyethylene glycol in solid form, can be added to the powder mixture before the filling operation. A disintegrant or solubiliser, such as, for example, agar-agar,
35 calcium carbonate or sodium carbonate, may likewise be added in order to improve the availability of the medicament after the capsule has been taken.

In addition, if desired or necessary, suitable binders, lubricants and disintegrants as well as dyes can likewise be incorporated into the mixture. Suitable binders include starch, gelatine, natural sugars, such as, for example, glucose or beta-lactose, 5 sweeteners made from maize, natural and synthetic rubber, such as, for example, acacia, tragacanth or sodium alginate, carboxymethylcellulose, polyethylene glycol, waxes, and the like. The lubricants used in these dosage forms include sodium oleate, sodium stearate, magnesium stearate, sodium benzoate, sodium acetate, 10 sodium chloride and the like. The disintegrants include, without being restricted thereto, starch, methylcellulose, agar, bentonite, xanthan gum and the like. The tablets are formulated by, for example, preparing a powder mixture, granulating or dry-pressing the mixture, adding a lubricant and a disintegrant and pressing the 15 entire mixture to give tablets. A powder mixture is prepared by mixing the compound comminuted in a suitable manner with a diluent or a base, as described above, and optionally with a binder, such as, for example, carboxymethylcellulose, an alginate, gelatine or polyvinylpyrrolidone, a dissolution retardant, such as, for example, paraffin, an absorption accelerator, such as, for example, a quaternary salt, and/or 20 an absorbant, such as, for example, bentonite, kaolin or dicalcium phosphate. The powder mixture can be granulated by wetting it with a binder, such as, for example, syrup, starch paste, acadia mucilage or solutions of cellulose or polymer materials and pressing it through a sieve. As an alternative to granulation, the powder mixture 25 can be run through a tabletting machine, giving lumps of non-uniform shape, which are broken up to form granules. The granules can be lubricated by addition of stearic acid, a stearate salt, talc or mineral oil in order to prevent sticking to the tablet casting moulds. The lubricated mixture is then pressed to give tablets. The compounds according to the invention can also be combined with a free-flowing inert excipient 30 and then pressed directly to give tablets without carrying out the granulation or dry-pressing steps. A transparent or opaque protective layer consisting of a shellac sealing layer, a layer of sugar or polymer material and a gloss layer of wax may be present. Dyes can be added to these coatings in order to be able to differentiate 35 between different dosage units.

Oral liquids, such as, for example, solution, syrups and elixirs, can be prepared in the form of dosage units so that a given quantity comprises a pre-specified amount of the compound. Syrups can be prepared by dissolving the compound in an aqueous solution with a suitable flavour, while elixirs are prepared using a non-toxic alcoholic vehicle. Suspensions can be formulated by dispersion of the compound in a non-toxic vehicle. Solubilisers and emulsifiers, such as, for example, ethoxylated isostearyl alcohols and polyoxyethylene sorbitol ethers, preservatives, flavour additives, such as, for example, peppermint oil or natural sweeteners or saccharin, or other artificial sweeteners and the like, can likewise be added.

The dosage unit formulations for oral administration can, if desired, be encapsulated in microcapsules. The formulation can also be prepared in such a way that the release is extended or retarded, such as, for example, by coating or embedding of particulate material in polymers, wax and the like.

The compounds of the formula I and pharmaceutically salts, tautomers and stereoisomers thereof can also be administered in the form of liposome delivery systems, such as, for example, small unilamellar vesicles, large unilamellar vesicles and multilamellar vesicles. Liposomes can be formed from various phospholipids, such as, for example, cholesterol, stearylamine or phosphatidylcholines.

The compounds of the formula I and the salts, tautomers and stereoisomers thereof can also be delivered using monoclonal antibodies as individual carriers to which the compound molecules are coupled. The compounds can also be coupled to soluble polymers as targeted medicament carriers. Such polymers may encompass polyvinylpyrrolidone, pyran copolymer, polyhydroxypropylmethacrylamidophenol, polyhydroxyethylaspartamidophenol or polyethylene oxide polylysine, substituted by palmitoyl radicals. The compounds may furthermore be coupled to a class of biodegradable polymers which are suitable for achieving controlled release of a medicament, for example polylactic acid, poly-epsilon-caprolactone, polyhydroxybutyric acid, polyorthoesters, polyacetals, polydihydroxypyrans, polycyanoacrylates and crosslinked or amphipathic block copolymers of hydrogels.

Pharmaceutical formulations adapted for transdermal administration can be administered as independent plasters for extended, close contact with the epidermis of the recipient. Thus, for example, the active ingredient can be delivered from the
5 plaster by iontophoresis, as described in general terms in Pharmaceutical Research, 3(6), 318 (1986).

Pharmaceutical compounds adapted for topical administration can be formulated as
10 ointments, creams, suspensions, lotions, powders, solutions, pastes, gels, sprays, aerosols or oils.

For the treatment of the eye or other external tissue, for example mouth and skin, the
15 formulations are preferably applied as topical ointment or cream. In the case of formulation to give an ointment, the active ingredient can be employed either with a paraffinic or a water-miscible cream base. Alternatively, the active ingredient can be formulated to give a cream with an oil-in-water cream base or a water-in-oil base.

20 Pharmaceutical formulations adapted for topical application to the eye include eye drops, in which the active ingredient is dissolved or suspended in a suitable carrier, in particular an aqueous solvent. Pharmaceutical formulations adapted for topical application in the mouth encompass lozenges, pastilles and mouthwashes.

25 Pharmaceutical formulations adapted for rectal administration can be administered in the form of suppositories or enemas. Pharmaceutical formulations adapted for nasal administration in which the carrier substance is a solid comprise a coarse powder having a particle size, for example, in the range 20-500 microns, which is
30 administered in the manner in which snuff is taken, i.e. by rapid inhalation via the nasal passages from a container containing the powder held close to the nose. Suitable formulations for administration as nasal spray or nose drops with a liquid as carrier substance encompass active-ingredient solutions in water or oil.

35 Pharmaceutical formulations adapted for administration by inhalation encompass finely particulate dusts or mists, which can be generated by various types of pressurised dispensers with aerosols, nebulisers or insufflators. Pharmaceutical

formulations adapted for vaginal administration can be administered as pessaries, tampons, creams, gels, pastes, foams or spray formulations.

5 Pharmaceutical formulations adapted for parenteral administration include aqueous and non-aqueous sterile injection solutions comprising antioxidants, buffers, bacteriostatics and solutes, by means of which the formulation is rendered isotonic with the blood of the recipient to be treated; and aqueous and non-aqueous sterile suspensions, which may comprise suspension media and thickeners. The
10 formulations can be administered in single-dose or multidose containers, for example sealed ampoules and vials, and stored in freeze-dried (lyophilised) state, so that only the addition of the sterile carrier liquid, for example water for injection purposes, immediately before use is necessary. Injection solutions and suspensions prepared in
15 accordance with the recipe can be prepared from sterile powders, granules and tablets.

It goes without saying that, in addition to the above particularly mentioned
20 constituents, the formulations may also comprise other agents usual in the art with respect to the particular type of formulation; thus, for example, formulations which are suitable for oral administration may comprise flavours.

A therapeutically effective amount of a compound of the formula I depends on a
25 number of factors, including, for example, the age and weight of the animal, the precise condition that requires treatment, and its severity, the nature of the formulation and the method of administration, and is ultimately determined by the treating doctor or vet. However, an effective amount of a compound according to the invention is generally in the range from 0.1 to 100 mg/kg of body weight of the recipient (mammal) per day and particularly typically in the range from 1 to 10 mg/kg of
30 body weight per day. Thus, the actual amount per day for an adult mammal weighing 70 kg is usually between 70 and 700 mg, where this amount can be administered as a single dose per day or usually in a series of part-doses (such as, for example, two,
35 three, four, five or six) per day, so that the total daily dose is the same. An effective amount of a salt or solvate or of a physiologically functional derivative thereof can be

determined as the fraction of the effective amount of the compound according to the invention *per se*. It can be assumed that similar doses are suitable for the treatment of other conditions mentioned above.

- 5 A combined treatment of this type can be achieved with the aid of simultaneous, consecutive or separate dispensing of the individual components of the treatment. Combination products of this type employ the compounds according to the invention.
- 10 The invention furthermore relates to medicaments comprising at least one compound of the formula I and/or pharmaceutically acceptable salts, tautomers and stereoisomers thereof, including mixtures thereof in all ratios, and at least one further pharmaceutically active ingredient (being synonymous with a medicament active ingredient).
- 15

The invention also relates to a set (kit) consisting of separate packs of

- (a) an effective amount of a compound of the formula I and/or pharmaceutically acceptable salt, tautomer and stereoisomer thereof, including mixtures thereof in all ratios, and
- (b) an effective amount of a further pharmaceutically active ingredient.

The kit comprises suitable containers, such as boxes, individual bottles, bags or

- 25 ampoules. The kit may, for example, comprise separate ampoules, each containing an effective amount of a compound of the formula I and/or pharmaceutically acceptable salts, tautomers and stereoisomers thereof, including mixtures thereof in all ratios, and an effective amount of a further medicament active ingredient in dissolved or lyophilised form.
- 30

“Treating” as used herein, means an alleviation, in whole or in part, of symptoms

associated with a disorder or disease, or slowing, or halting of further progression or worsening of those symptoms, or prevention or prophylaxis of the disease or disorder

- 35 in a subject at risk for developing the disease or disorder.

The term "effective amount" in connection with a compound of formula I can mean an amount capable of alleviating, in whole or in part, symptoms associated with a disorder or disease, or slowing or halting further progression or worsening of those symptoms, or preventing or providing prophylaxis for the disease or disorder in a subject having or at risk for developing a disease disclosed herein, such as inflammatory conditions, immunological conditions, cancer or metabolic conditions.

The expression "effective amount" denotes the amount of a medicament or of a pharmaceutical active ingredient which causes in a tissue, system, animal or human a biological or medical response which is sought or desired, for example, by a researcher or physician. In addition, the expression "therapeutically effective amount" denotes an amount which, compared with a corresponding subject who has not received this amount, has the following consequence: improved treatment, healing, prevention or elimination of a disease, syndrome, condition, complaint, disorder or side-effects or also the reduction in the advance of a disease, complaint or disorder. The expression "therapeutically effective amount" also encompasses the amounts which are effective for increasing normal physiological function.

In one embodiment an effective amount of a compound of formula I is an amount that inhibits c-KIT kinase in a cell, such as, for example, *in vitro* or *in vivo*. In some embodiments, the effective amount of the compound of formula I inhibits c-Kit in a cell by 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90% or 99%, compared to the activity of c-KIT kinase in an untreated cell. The effective amount of the compound of formula I, for example in a pharmaceutical composition, may be at a level that will exercise the desired effect; for example, about 0.005 mg/kg of a subject's body weight to about 10 mg/kg of a subject's body weight in unit dosage for both oral and parenteral administration.

Assays and Measurements

30

c-Kit(V654A) assay:

c-Kit(V654A) (N-terminal GST-tagged, recombinant human c-Kit, amino acids 544–end containing the V654A mutation) is incubated with 8 mM MOPS pH 7.0, 0.2 mM EDTA, 250 µM GGMEDIYEFMGGKKK, 10 mM MgAcetate and [gamma-33P-ATP]

35 (specific activity approx. 500 cpm/pmol, concentration 200 µM). The reaction is initiated by the addition of the MgATP mix. After incubation for 40 minutes at room

temperature, the reaction is stopped by the addition of 3% phosphoric acid solution. 10 μ L of the reaction is then spotted onto a P30 filtermat and washed three times for 5 minutes in 75 mM phosphoric acid and once in methanol prior to drying and scintillation counting.

Assay principle for cellular testing of cKIT mutant inhibitors

The GIST430 cell line expressing constitutive active cKIT receptor tyrosine kinase (Δ 560-576 deletion) and the Imatinib resistant GIST430/654 cell line expressing mutated 10 constitutively active cKIT receptor tyrosine kinase (Δ 560-576 deletion and V654A point mutation) were employed for assessing cellular potency of compounds. Cellular activity of mutant cKIT was determined by the degree of cKIT autophosphorylation at tyrosine 307 using a Luminex-based bead assay. GIST430 cells were plated with 22,000 cells 15 per well of a 96-well plate in 100 μ l medium (85% IMDM / 15% FCS) and GIST430/654 cells were plated with 25,000 cells per well of a 96-well plate in 100 μ l medium (85% IMDM / 15% FCS supplemented with 100 nM Imatinib). At the following day compounds 20 were added in a serial dilution for 45 min. Then, cells were lysed with 90 μ l lysis buffer (20 mM Hepes pH 7.5, 200 mM NaCl, 1.5 mM MgCl₂·6H₂O, 0.4 mM EDTA, 1% Triton-X-100, 1% Phosphatase-Inhibitor II, 20mM β -Glycerolphosphat, 0.1% Protease-Inhibitor 25 Cocktail III, 0.01 % Benzonase) und lysates were cleared by centrifugation through a 96-well filter plate (0.65 μ m). Samples were incubated with Luminex-beads which were coupled with an anti-total cKIT antibody overnight at 4°C under gentle agitation. For detection of phospho-Y307-cKIT a phosphospecific antibody and a species-specific PE-labelled secondary antibody were added. The amount of phospho-Y307-cKIT was determined in a Luminex 200 instrument measuring 100 events per well within 60 seconds.

30 Counts from samples treated with compounds were calculated as percent of control from solvent treated (0.3% DMSO) samples. Dose-response curves were fitted and IC₅₀ values were determined using Genedata Screener software.

Determination of efflux-ratio (ER) in Caco-2 cells

The efflux ratio of the test compounds was determined in Caco-2 human epithelial colorectal adenocarcinoma cell line (TC7 clone) using calculation of apparent permeability (P_{app}). Cell monolayers were differentiated *in vitro* for 14 days before the

5 experiment. Subsequently, the test compound (in HBSS pH 7.4 at 1 μ M final concentration) was applied on the donor side while HBSS buffer (pH 7.4) was added to the receiver wells. The final DMSO concentration at incubation did not exceed 1%. The plate was then incubated in a 5% CO₂ incubator (37°C, 100% humidity). At the 10 end of the 2 hours incubation period, 50 μ L sample was removed from both donor and receiver wells and diluted 1:1 with equal volumes of acetonitrile for LC-MS/MS analysis. The LC-MS/MS analysis used a one-point calibration method from a 1 μ M standard solution diluted 1:1 with equal volume of acetonitrile (consistent to the test 15 samples).

The data was used to calculate the apparent permeabilities of the compounds in both apical to basolateral ($P_{app,AB}$) and basolateral to apical ($P_{app,BA}$) directions at 1 μ M concentration in duplicate. The P_{app} values were calculated from the concentrations in the donor and receiver compartments using the following formula:

$$P_{app} = \frac{\Delta C_{rec}}{\Delta t} \cdot \frac{V_{rec}}{A \cdot C_0} \cdot 10^6$$

Efflux ratio was calculated according to the following formula:

$$ER = \frac{P_{app,BA}}{P_{app,AB}}$$

P_{app} = apparent permeability through cell monolayer (10⁻⁶ cm/s)

30 $\Delta C_{rec}/\Delta t$ = Concentration change in receiver well over time (nM/s)

V_{don}, V_{rec} = Volume of donor/receiver wells = 0.25 mL (apical) or 0.75 mL
(basolateral)

C_{don}, C_{acc} = Concentration in donor/receiver well at the end of the experiment (nM)

$C_{0,don}$ = Concentration in donor well at the beginning of the experiment (nM)

35 A = Surface area of well membrane = 0.33 cm²

Determination of solubility

In a 96 well filtration plate, 2 µL of a 10 mM solution of the test compound in DMSO is added to 98 µL of 20 mM Sorensen phosphate buffer with pH 7.4. The mixture is
5 incubated at room temperature for 120 min while agitating at 250 rpm followed by centrifugation at 2500 rpm for 3 min. After dilution by a factor of 2, the concentration of the test compound is determined using HPLC/UPLC with detection at a suitable wavelength and by comparison to a corresponding compound standard.

EXAMPLES

As depicted and described in the examples below, in certain exemplary embodiments, compounds are prepared according to the following general procedures. It will be appreciated that, although the general methods depict the synthesis of certain compounds of the present invention, the following general methods, and other methods known to one of ordinary skill in the art, can be applied to all compounds and subclasses and species of each of these compounds, as described herein.

20

The following data, determined by the assays described above and set out in Tables 2 and 3 below, illustrate the potency of embodiments of the present invention in terms of cKit (V654A) respectively GIST 430/654 inhibition. As apparent from the Tables, the compounds have excellent IC₅₀ values, many in the low nanomolar range. In addition, 25 the compounds are selective, in particular as compared to closely related kinase FLT3 ("fms like tyrosine kinase 3"). Embodiments that were tested against a broader panel of kinases, including JAK, have been found to show very good selectivity over those kinases, too.

30

In addition to the excellent inhibitory potencies, certain preferred embodiments of the present invention have been found to have a balance of promising pharmacokinetic properties, including bioavailability, as experimentally determined by solubility and efflux, and acceptable to excellent values concerning the undesired blockage of the
35

hERG potassium channel. Results of experimental efflux measurements are given in Table 4 below.

Exemplary embodiments A8, A12, A15, A60, A73, A75, A83, A84, A99, A100,
5 A102, A120, A149, A153, A154, A156, A168, A170, A212, A242 and A252 were determined as having a favourable solubility of at least 25 µM.

To a solution of N-Boc-4-bromobenzylamine (29.4 g, 103 mmol) in 1,2-dimethoxyethane (275 ml) are added 1-methyl-1H-pyrazole-4-boronic acid pinacol ester (25.5 g, 122.6 mmol), water (105 ml) and sodium carbonate (16.3 g, 154 mmol) and the resultant suspension is flushed with argon. Under argon, bis(triphenylphosphine)palladium(II) chloride (2.9 g, 4.13 mmol) is added. The mixture is heated to 80 °C and stirred at this temperature for 2 days. The reaction mixture is allowed to reach room temperature and treated with water and ethyl acetate. The organic phase is separated and the aqueous phase is extracted two times with ethyl acetate. The combined organic phases are dried over sodium sulfate and evaporated. The residue is chromatographed on a silica gel column with cyclohexane/ethyl acetate as eluent to afford tert-butyl N-[4-(1-methyl-1H-pyrazol-4-yl)phenyl]methyl]carbamate as pale yellow crystalline solid; UPLC/MS 0.709 min, [M+H]⁺ 288.

Synthesis of 6-{7-fluoroimidazo[1,2-a]pyridin-3-yl}-N-[{4-(1-methyl-1H-pyrazol-4-yl)phenyl}methyl]pyrimidin-4-amine ("H1")

A suspension of 6-[(E)-2-ethoxyethyl]-N-{{[4-(1-methyl-1H-pyrazol-4-yl)phenyl]methyl}pyrimidin-4-amine (**G1**) (335 mg, 1.00 mmol) in a mixture of 1,4-dioxane (4.5 ml) and water (1.5 ml) is cooled to 0° C and N-bromosuccinimide (196 mg, 1.10 mmol) is added in portions over a period of 15 minutes. After the last addition, the reaction mixture is stirred for 20 minutes at 0° C. 2-Amino-4-fluoropyridine (118 mg, 1.00 mmol) is added. The reaction solution is heated to 60° C and stirred at this temperature for 2 hours. The reaction mixture is allowed to reach temperature and poured into aqueous 1 N NaOH solution (25 ml). The resultant mixture is stirred for several hours. The resultant solid material is filtered off, washed with water, dried and chromatographed on a silica gel column with dichloromethane/methanol as eluent to afford 6-{7-fluoroimidazo[1,2-a]pyridin-3-yl}-N-{{[4-(1-methyl-1H-pyrazol-4-yl)phenyl]methyl}pyrimidin-4-amine as pale yellow crystalline solid; HPLC/MS(B) 0.794 min, [M+H]⁺ 400.

30 From "A172"; To a suspension of 2-{3-[6-({[4-(1-methyl-1H-pyrazol-4-yl)phenyl]methyl}amino)pyrimidin-4-yl]imidazo[1,2-a]pyridin-7-yl}oxy)ethan-1-ol (10.0 g, 22.6 mmol) in DMF (150 ml) is added triphenylphosphine (8.91 g, 34.0 mmol).

Then carbon tetrabromide (11.27 g, 34.0 mmol) is added portionwise with stirring during 20 min, while cooling the mixture in a cold water bath. The reaction mixture is stirred at room temperature for 18 hours. The solvent is removed under reduced pressure. The residue is triturated with diethyl ether and ethyl acetate. The resultant solid is chromatographed on a silica gel column with methanol/chloroform as eluent to afford 6-[7-(2-bromoethoxy)imidazo[1,2-a]pyridin-3-yl]-N-{{[4-(1-methyl-1H-pyrazol-4-yl)phenyl]methyl}pyrimidin-4-amine as white solid.

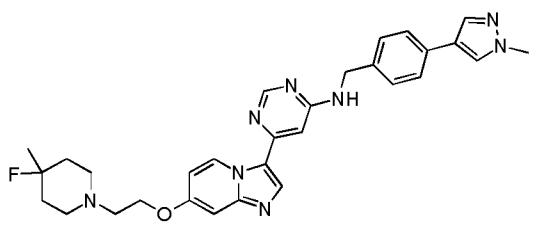

- 10 A reaction vial is charged with 6-[7-(2-bromoethoxy)imidazo[1,2-a]pyridin-3-yl]-N-{{[4-(1-methyl-1H-pyrazol-4-yl)phenyl]methyl}pyrimidin-4-amine (50.0 mg, 0.1 mmol), the corresponding amine (0.2 mmol) and DMF (0.3 ml) and the mixture is heated for 18 hours at 90° C. The reaction mixture is allowed to reach room temperature and 15 evaporated. The residue is purified by preparative HPLC with methanol/aqueous ammonia as eluent.
